

Primus Workbench for automated Master Data Management

Oracle Process and Discrete Manufacturing

Business Requirement

For many manufacturers with a large number of products to track or sell, setting up items in an Oracle ERP system (E-Business Suite) requires significant effort and is a complex and expensive task. Costs associated with data maintenance often grow enormously.

The main challenge in larger organizations is that the master data within the ERP system is critically important to business operations and financial reports. Often there is a lack of transparency within the organization who may be changing the master data and why. Consequently incomplete or inaccurate items setup can endanger product delivery, lead to inaccurate cost of goods sold, calculations and finally affect profitability.

Primus Solutions has developed the master data management workbench to assist you in improving order processing and delivery and overall cost and pricing transparency and finally having satisfied customers.

Business Benefits

Controlled Data Entry

The Primus MDM workbench enables you to control and automate the setup of items within your departments. A workflow controls the entire process of entering the master data.

Immediate Time and Cost Savings

Utilizing Primus MDM workbench can save you up to 70% of time regarding the entering and searching of master data. Default values from a sample item can be completed, changed and displayed in the organization in one go. The item setup process can be accelerated by 50% depending on the company's organization.

Reliable Data Quality

The reliability of Business Processes depends on their corresponding data quality. Default values from sample items and validation rules enable reliable data Quality by displaying each step in the configuration process for each item.

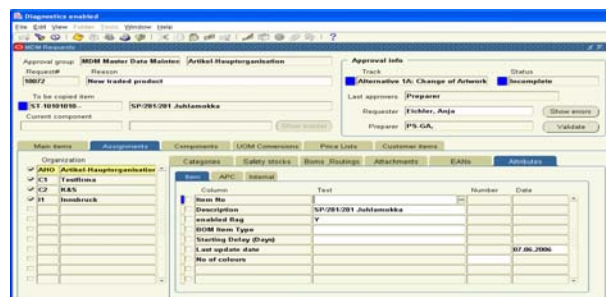

How it works

The Primus MDM workbench initializes the corresponding screens with data from a sample

item. Mandatory fields can be assigned to different roles involved in the data entry process. This provides the necessary flexibility for each company, since the item setup process is somewhat unique to each company.

Easy to use

The self-explanatory interface lets you change all data from a sample item before generating the required item and its components in one step.

Features

- Enhanced copy functionality
- Business Flow control for different departments
- Setup Workbench for definitions of processes mandatory fields
- Applicable for different operating units

Objects covered

- Items (different items and components in one step), cross references, Advance product catalogue, customer items
- Routings and Bill of Materials
- Safety stocks, Price Lists, Inter- and Intra Class Conversions

The workbench is designed for Oracle E-Business Suite customers using discrete and/or process manufacturing modules.
